SCALPING, SEEDING, FERTILISING

SINGLE BLADE INNOVATIVE WEED CONTROL

In all conditions in organic farming. Weeding under cover crops or residue.

FULL SCALPING - STUBBLE CULTIVATION - SEEDBED PREPARATION

Under crops or cover crops with perfect ground following. Water & crops management.

SEED DRILL & STRIP SOWING

Autumn cereal or summer and fall cover crop.

SOLID OR LIQUID SIDE DRESSING

During scalping the blade applies nitrogen close to the roots on each side.

MODULAR & SCALABLE FRAME from **4** to **24 ROWS** **SPACING** from **50** to **80 CM**

ISOBUS LATERAL ACTIVE GUIDING

by camera or GPS.

GPS Row-by-row cut-off system.

Active hydraulic downforce system.

ROW UNIT

- 1 Versatile base module
- 2 Quick attach tool holder with innovative settings memory for every accessories
- 3 No tools attachment for lateral accessories
- 4 Easy attach holder for late stages and other tools

MODULAR
ATTACHMENT

ACTIVE ROW-BY-ROW CUT-OFF &
HYDRAULIC DOWNFORCE SYSTEM (GPS)

CONFIGURATION FULL

NON STOP HYDRAULIC
auto reset of the blade

DEPTH ADJUSTMENT
WITHOUT TOOLS

REAR TOOL HOLDER
For any finition
acesories of the market

LARGE TRAVEL
PARALLELOGRAM
Allowing 85cm clearance
under the machine's chassis

NON STICKY
GAUGE WHEEL

DISC OPENER &
SATBILIZER
With quick depth
adjustment

SMALL CROP CLEANER
The ripping effect of the disc
that run very close to the
crops protect leaves and
avoid roots cuttings

SCALPING BLADE (THE KNIFE)
Sharpy blade to control any
weeds size in organic farming.
Versatile blade for any row
spacing, scalping, seeding,
fertilizing

PLANT PROTECTION
In case of a need:
protects the plants by
avoiding projections on
the crop rows

BIRM BUILDERS DISC
At latest stages reverse
your weeds control strategy.
Instead of cutting the weeds,
cover them with soil

A POWERFUL TOOL FOR CONSERVATION FARMING

HOE

Single blade hoeing to control weeds population.

Much more aggressive system than a standard multi-tine hoe, which allows a drastic reduction of passes because you can control even large weeds.

● SEEDBED PREPARATION & COVER CROPS STRIP SOWING

During hoeing the Scalp prepares the seedbed and establishes cover crops in the ground. AGRISEM's environmental vision: providing solutions to manage cover or any small crops and thus store carbon in the ground and promote soil life.

● LIQUID SIDE DRESSING & SOLID SIDE DRESSING

Apply the right rate in the right place, close to the roots, with GPS modulation rate control. The Scalp provides excellent nitrogen placement for main crop. Nitrogen saving reach farming scale, with positive environmental impact.

Example: wheat in relay cropping from seeding in october to har-

- The lack of a viable solution for mechanical weeding led AGRISEM to develop a **new innovative single blade machine technic**. Penetration, crop residue and tall weeds have always been a problem for any scalper or weeding machine. The Scalp technique is suitable **for all working conditions from conventional to No-TILL** and particularly in the presence of plant cover.
- Organic farmers need machine for **full scalping**. Manufacturers have therefore modified their cultivators into very long machines that produce soil mixing which leads to carbon losses in the soil. The Scalp with its sharp blade and ground following provides a short machine that does not mix up soil layers and achieves a complete scalping.
- Combining his long experience as a seed drill manufacturer and his vision of conservation farming, Agrisem and a group of farmer worked on a new farming system to produce one or **two crops a year**. With carbon catching, soil preservation, water saving and nutrient optimization, the Scalp naturally position itself as a particularly innovative machine for **seedbed preparation** and as a **seed drill**.
- Our vision of green farming with the Scalp is also to find an alternative solution to herbicides for **weeds control**.
- The Scalp drives a new stage in **carbon storage**. The very low soil disturbance produces only active mineralization of crop residues, which are converted to soil carbon.
- Recurring droughts push us to find a way to **keep water in the ground** by two levers: 1 st, capillary break to stop water absorption by weeds, 2 nd, to work in cover crop and soil esidues conditions that prevent evaporation.

THE BEST OF SINGLE BLADE

Full scalping under heavy residue to save groundwater. Weeding under crop residue or cover crops, can eliminate any type of plants. Hoeing in crop at a very late stage without damaging it. The ideal replacement for Glyphosate !

Scalp in ryegrass where chemistry does not bring effective results

ROW UNIT

PRIORITY TO MODULARITY

- Parallelogram with 50cm travel for ground following on single row and individual lift to avoid damaging crops in the headland.
- Non-stop hydraulic auto reset of the blade
- Isobus & gps control
- RTK & camera guiding
- Lateral sliding to keep the right track of the row
- Individual row by row & blade lifting
- Retractable gauge wheels
